Global Equity-income investing

Debunking the myths
Challenging some of the myths surrounding equity-income investing

With income levels on traditional assets such as cash and government bonds having fallen in recent years, investors have found it harder to achieve sustainable growth.

Achieving the necessary income to meet objectives without taking on an unacceptable risk burden therefore presents a real challenge. Dividend-paying equities can offer significantly higher levels of income than bonds and cash, but investors have often not followed such an approach.

This is perhaps because equities have traditionally been associated with income volatility, as well as a perception that the growth potential of such a strategy may be limited. However, by focusing on companies with a disciplined approach to capital management, we believe an equity-income strategy can provide returns that remain relatively stable, even in down markets, as well as the prospect of attractive long-term capital growth.

By focusing on companies with a disciplined approach to capital management, we believe an equity-income strategy can provide returns that remain relatively stable, even in down markets, as well as the prospect of attractive long-term capital growth.

Nick Clay, Portfolio manager, global equity team, Newton
Dividend payments have clear appeal for investors who may require a regular income, but have often been overlooked as a platform for growth. However, thanks to the exceptional power of compounding, the reinvestment of dividends over time can turn equity income into an effective growth strategy for the long-term investor.

A recent study illustrated how capital gains accounted for the growth of $1 invested in US equities at the beginning of 1900 to $215 at the end of 2011. However, the additional effect of income and its reinvestment turned that original investment of $1 into $21,978. Accordingly, dividends and their reinvestment accounted for 99% of US equity returns over the period.1

Exhibit 1 further demonstrates how real returns over the last 45 years from various equity markets, including the UK, France and the US, have been dominated by the compounding effects of dividend yield.

Dividend-paying companies have little growth potential

Many investors presume that, by following an income-focused strategy, they are likely to suffer by investing only in bond-like businesses that have little or no growth potential, since paying a dividend may be viewed as evidence of the scarcity of a company’s investment opportunities. But there is much evidence to suggest this argument is flawed.

In a now famous study of US equities by Arnott and Asness, it was shown that there was actually a positive correlation between a company’s pay-out ratio and subsequent earnings growth.2 Further analysis indicates that the same is true in other equity markets.3 These studies suggest that the payment of a dividend actually encourages greater capital discipline. Contrary to popular belief, many companies are poor at allocating capital, with most driven by the desire for growth over and above returns. One of the most obvious examples of this dynamic is that merger and acquisition (M&A) activity tends to peak at the point valuations are rich (or overpriced), whereas logic would dictate that M&A activity should peak at the troughs in markets.

If capital is allocated correctly, there is a better chance of supporting and sustaining returns on invested capital. A disciplined attitude to allocating capital, in turn, leads to surplus cash flows being returned to shareholders in the form of dividends.

Consequently, it is possible to gain exposure in a deliberate fashion to very different end markets. Stable, durable, predictable non-cyclical stocks, such as utilities and health care, can be selected as well as pro-cyclical economically sensitive ones, such as mining companies, industrials and financials. What dictates those choices is an appreciation of the position in the capital allocation cycle within those industries and an understanding of the correct valuation to pay for such stocks.

Investors may shy away from using equities for income purposes on account of the perceived unpredictability of dividend yields, especially during market downturns or when conditions are volatile. However, we contend that dividend income can be relatively stable across both up and down markets.

Once a dividend is established, companies tend to maintain payments in order to avoid sending a negative signal to investors. This is demonstrated by exhibit 2, which shows the relative resilience of dividends across varied market conditions.

In an uncertain environment, investors may be drawn behaviourally to the relative certainty of a dividend payment, and they attach greater importance to the signal given by the solidity of a dividend payment in a downturn. This leads to the outperformance of dividend-paying companies in down markets, and so lends an ‘asymmetry’ to returns. Therefore, investors may, by concentrating on the income they receive, better withstand the volatility in the economy and in the capital value of their portfolios.

Furthermore, with near-zero interest rates unlikely, we think, to rise dramatically in the near future, income returns on assets such as government bonds and cash deposits remain at historic lows, and in many cases below the rate of inflation. In such a challenging environment, investing in dividend-paying equities – which provide yields that are high compared to other assets – can offer investors the comfort of an attractive income stream in an otherwise low-return environment, and provide a shield against inflation.

4 Fuller and Goldstein, Do dividends matter in a declining market? (University of Mississippi and Babson College, 2005).
Conclusion

An equity income strategy:

- has the potential to deliver higher returns than non-income-focused strategies owing to the power of compounding
- may also offer attractive long-term capital growth for investors
- has been shown to be less volatile than a growth-oriented approach to equity investment
- may offer some protection from inflation
- benefits from an active investment approach that focuses on companies that have a disciplined approach to capital management and are able to provide sustainable returns.

It’s all about chasing yield

The difference between forecast and realised dividend yields shown in exhibit 3 overleaf demonstrates that a passive investment approach based on forecast yields is not appropriate. In order for an equity income strategy to be successful, careful analysis of how companies and governments allocate their capital is critical. Entities with a disciplined approach to capital management should be better positioned to provide consistent and sustainable returns.

At Newton, we employ a yield discipline in our equity-income strategies, dictating strict parameters (in relation to the relevant equity index) at which a stock may be bought and must be sold. This provides an element of objectivity to the management of those strategies. Nevertheless, we argue that a share should never be bought on the basis of its dividend yield alone.

By being alert to the evolutions in industries and changing valuations, one can better understand how to position the portfolio and avoid the trap of high yields and the risk of dividends being cut. We use thorough analysis, underpinned by our long-term framework of global investment themes, to identify those companies which offer a sustainable dividend yield.

Nick Clay
Lead manager of the Newton Global Income Fund and BNY Mellon Global Equity Income Fund
Nick has been a member of Newton’s global equity team since 2012. He is a member of a number of investment groups, and chairs the equity income group. Prior to joining Newton in 2000, Nick acquired a range of experience as a UK equities manager at Morley Fund Management and as an analyst at Sun Alliance. Nick is an associate member of the UK Society of Investment Professionals.

Terry Coles
Portfolio manager, global equity team
Terry is a portfolio manager within the global equities team, and is responsible for the management of a number of global equity and global equity income portfolios.

Ian Clark
Global research analyst, global equity and real return team
Ian is part of the Newton global equity team specialising in the global income strategy. He is also a member of the real return team with responsibility for generating investment ideas, monitoring and maintaining existing positions, as well as client marketing.
**Newton Global Equity Income strategy – summary**

By investing over the long term in income-generating equities, our Global Equity Income strategy aims to provide investors with increasing annual distributions together with capital growth.

- Investing in cash-generative companies with attractive dividend yields, according to our analysis
- Conviction-based strategy with globally diversified approach
- Aiming for asymmetric returns, with valuation screen to help achieve dividend yield above that of the comparative index

**Strategy inception**
1 January 2006

**Strategy size**
£6.1 billion (31 December 2015)

**Investment policy**
- All new holdings must have a prospective yield 25% greater than the FTSE World Index yield
- Any holding whose prospective yield falls below the FTSE World Index yield will be sold5
- Portfolio of 50-80 stocks, not constrained by any country, regional, sector or industry restrictions

---

5 On account of liquidity, it may not be possible to dispose of an entire holding immediately.

---

**Newton Global Income Fund**

- **LAUNCH DATE:** 30 November 2005
- **OBJECTIVE:** The objective is to achieve increasing income and capital growth over the long-term from investing predominantly in global securities. The Fund may also invest in collective investment schemes.
- **DOMICILE:** UK
- **BASE CURRENCY:** GBP
- **COMPARATIVE INDEX:** IA Global Equity Income
- **HISTORIC YIELD:** 3.6%
- **AUM:** Ten year old Fund has grown to over £4.4bn in assets

---

6 Effective as at 1 April 2015, the Newton Global Higher Income Fund was renamed Newton Global Income Fund.

---

7 Effective as at 30 November 2015, the BNY Mellon Global Equity Higher Income Fund was renamed BNY Mellon Global Equity Income Fund.

---

**BNY Mellon Global Equity Income Fund**

- **LAUNCH DATE:** 29 July 2010
- **OBJECTIVE:** The objective is to achieve increasing income and capital growth over the long-term from investing predominantly in global securities. The Fund may also invest in collective investment schemes.
- **DOMICILE:** Dublin, Ireland
- **BASE CURRENCY:** USD
- **COMPARATIVE INDEX:** Lipper Global - Equity Global Income
- **HISTORIC YIELD:** 3.4%
- **AUM:** USD $466 million

**Important information**

Past performance is not a guide to future performance. The value of investments and the income from them is not guaranteed and can fall as well as rise due to stock market and currency movements. When investments are sold, investors may get back less than they originally invested.
